

How IITG’s tech platform aims to make Ahmedabad flood-free

Rain2Resilience combines citizen reports, live forecasts, and GPU-driven modelling to deliver real-time flood info

Ritu Sharma
Ahmedabad, August 10

AHMEDABAD’S FLOODING hotspots are not permanent points on a map.

Picture this: Indraprastha Complex, the commercial area around one of the busiest and upscale roads—the Drive-in Road near Himalaya Mall—was flooded after heavy rainfall in Ahmedabad on July 23. Nearly 40 shops in the complex remained flooded for days. This was not the case for over two decades, the owners, who suffered losses running into crores of rupees, said.

Thus, in Ahmedabad, a road that remains passable in one monsoon can become a serious waterlogging location the next year because of blocked inlet, altered road level, new construction site, drainage bottlenecks, intense short-duration rainfall or backwater conditions.

For city officials, it creates a difficult operational challenge, the Ahmedabad civic body authorities stated, adding that during heavy rain, teams must simultaneously respond to complaints, deploy field staff, manage pumping and drainage operations, protect critical routes, coordinate public communication and prepare for the next spell.

Looking at the available information, which is often fragmented across maps, rain gauges, field teams, citizen messages and separate departmental records, the Indian Institute of Technology Gandhinagar’s (IITG) ‘Rain2Resilience’ platform for Ahmedabad Municipal Corporation (AMC) seeks to bring these pieces together.

IIT Gandhinagar is developing the end-to-end urban flood monitoring and decision-support system with support from its Research Park incubation system.

However, the purpose is not to create another static flood map, but to help city teams understand emerging flood risk and test response options before committing time and public

During the recent trial, residents were able to upload a photograph of waterlogging along with the location, approximate flood depth, time and a brief description. FILE

resources.

“As Ahmedabad city has increasingly become prone to flooding in the last few years, as various parts of the city get submerged for days due to heavy and sudden rainfall events, we hope this will effectively address this problem. This is a technology-based system that collects rainfall forecasts, areas prone to waterlogging, drainage network and weather information at one place, helping the administration to provide timely warnings and take appropriate decisions,” said Ahmedabad Municipal Commissioner Banchhanidhi Pani.

The platform, launched July 31, will combine rainfall observations, rainfall nowcasting and forecast products, drainage and geospatial layers, satellite information, field evidence and relevant water conditions outside the municipal boundary.

This matters because urban flooding can be compound in nature: intense local rainfall may interact with drainage constraints, backwater effects and connected water systems beyond the city itself.

The idea is already visible in an experimental flood-reporting portal developed by the team.

“If a school route repeatedly floods, the important question is not only where water has accumulated. The city should be able to test what might reduce

the depth, duration or disruption: a drainage improvement, pumping plan, storage option or another targeted intervention. That is the shift from mapping flood impacts to testing solutions,” said Prof Udit Bhatia, Assistant Professor in Civil Engineering and Computer Science and Engineering at IIT Gandhinagar.

From a citizen report to city-scale intel

During the recent trial, residents were able to upload a photograph of waterlogging along with the location, approximate flood depth, time and a brief description. For AMC, this creates a new kind of local evidence. A resident’s report is no longer only a complaint to be resolved; it can become a verified observation and citizen partnership that helps identify emerging hotspots, validate flood-model outputs and guide field response.

“When such reports are combined with rainfall, drainage, terrain, satellite and forecast information, the system can distinguish between an isolated incident and a recurring or rapidly worsening flood-risk location,” explains Prof Udit Bhatia.

GPU-scaled models and a scenario lab

At the centre of the system is FloodAstra-GPU, an in-house graphics processing unit-scaled flood modelling engine. The

high-performance computing capability is intended to allow city-scale flood scenarios to be processed quickly enough to support operational planning, rather than only post-monsoon analysis. It also gives the project local scientific control over the model: it can be inspected, adapted and improved for Ahmedabad’s own terrain, drainage network, rainfall patterns and field evidence.

The team has already demonstrated the idea through FloodAstra-GPU work in Gurugram, where the system brings together rainfall, drainage, terrain, citizen reports, GIS layers and operational scenarios. The same approach is now proposed for Ahmedabad through Rain2Resilience, with an emphasis on municipal workflows, compound flooding and locally relevant response planning.

“Urban flooding is a long-term and difficult urban challenge. It evolves quickly during a storm, but its drivers build up over time as rainfall patterns, drainage conditions and urban form change. Municipal teams already have too much on their plate during a major rain event. Scientific solutions are needed to translate rainfall, drainage, field observations and citizen reports into practical decision support,” Prof Udit Bhatia from IIT Gandhinagar told The Indian Express.

A key feature of the pro-

The platform will combine rainfall observations, rainfall nowcasting and forecast products, drainage and geospatial layers, satellite information, field evidence and water conditions outside the municipal boundary

posed platform is the ‘Scenario Lab’. It would allow teams to examine potential interventions such as improving a drainage connection, deploying temporary pumping, creating local storage, protecting a critical route or identifying recharge opportunities. “The objective is not to replace engineering surveys or detailed design. Rather, it is to identify where field verification and detailed investment should be prioritised,” he adds.

The team states that the long-term aim is a living flood-intelligence system that learns from every monsoon. As rainfall records, field surveys, municipal data, satellite products, sensors and citizen reports accumulate, the system can improve its understanding of Ahmedabad’s evolving hotspots. For residents, the intended benefit is claimed to be direct, quicker recognition of flooding, better-informed municipal response, and a clearer path from an on-ground report to city-level action.

Lions that attack humans to be sent to designated enclosure

Express News Service
Ahmedabad, August 10

THE GUJARAT government announced on Sunday that lions that attack humans would be relocated to a designated enclosure at the Ambardi Safari Park in Amreli district.

“So far, such lions have been kept at the Sakkarbaug zoo in Junagadh. The newly planned designated enclosure will be in a natural habitat, and lions will have natural prey there. They will be able to move freely in this enclosure,” Principal Chief Conservator of Forests and Head of Forest Force Jaipal Singh told The Indian Express.

According to Singh, about 10 such lions are at the Sakkarbaug zoo.

The forest department has floated a tender to set up a designated enclosure in Dhari, which it expects to be ready in three months, officials said on the eve of World Lion Day.

The Ambardi Safari Park is an important wildlife tourism destination in the state. Spread across approximately 365 hectares, it offers visitors an experience of Gir’s natural environment. Along with Asiatic lions, leopards, chital, nilgai, chinkara, peacocks, and various bird species are also conserved there.

“Established in 2017, Ambardi Safari Park has been developed with the objective of promoting wildlife conservation and increasing awareness about nature. With modern safari facilities, a lush natural environment and the opportunity to experience Gir’s wildlife up close, the park attracts a large number of tourists every year. Along with promoting local employment, the park is also making an important contribution to the development of eco-tourism in Amreli district. Ambardi Safari Park has emerged as a major attraction for tourists interested in

wildlife,” a government release stated.

In recent months, the state has witnessed a spike in lion attacks in different parts.

‘Periodic relocation of wildlife crucial’

The release said the forest department periodically undertakes scientific relocation of wildlife to reduce human-wildlife conflict, provide safe habitats for animals, maintain ecological balance and ensure the long-term conservation of species.

“There are generally several reasons behind the relocation of wild animals. When an animal enters a village or populated area, it is safely captured and released back into the forest. In addition, relocation is carried out for the treatment of injured or sick animals, population management, and providing suitable habitat,” it explained.
